## QUBIK

The unplanned mission of an unbuilt satellite to be integrated into a deployer that does not exist

It was a quiet summer evening  
(somewhere)

We got a phone call  
(it was an email)

- *We have a 1p slot available for a PocketQube, are you interested?*

...

- *Great have it ready to go to space by December. BYE*

Clipart by Jasfart from the Noun Project

# There is a COMMS available

aaaand that's it..

# The Plan

## HARDWARE

1. Test COMMS
2. Add power
3. Add PV panels
4. Add structure
5. Bolt everything on a plate
6. Bakeout
7. Protoflight campaign
8. Send it to be integrated to the deployer
9. Have pizza

## SOFTWARE

1. Find a purpose for the mission
2. Write some code that at least transmits what needed by mission
3. Flash the firmware
4. Have pizza

# The experiment

A LEOP satellite identification and orbit determination experiment

1. Unambiguously identify satellites as soon as possible after deployment
2. Generate or update existing orbital elements based on Doppler curve tracking of satellite transmissions

<https://librespacefoundation.gitlab.io/qubik/qubik-docs/>

Identification via:

- Beacon preamble/post-amble
- Beacon decoding
- Beacon length
- Beacon cadence
- Spread spectrum low power beacon

Tracking:

- Modulation
- Beacon preamble/post-amble
- Residual carrier

# Meanwhile on the hardware department

## Power system

- Power budget
- Design solar panel circuits  
Built around SPV1040
- Design power management board  
Using MAX17261

## COMMS

- Minor modifications to suit mission

## Mechanical

- Design bottom plate to fit deployer
- Antenna release mechanism
- Structural design

# PCBs as a structural element

# Antenna

- Dipole antenna
- Release by dual thermal knife

# Good news everyone...

*- There is an extra slot available on the deployer if you want it*

Sure, we'll just build 2 of them

*- Oh and the deployer, well it's more of a concept, so could you...?*

...

*- Great, have a mass simulator for everything ready by next week. BYE*

# The Revised Plan

## HARDWARE

1. Test COMMS
2. Add power
3. Add PV panels
4. Add structure
5. Bolt everything on a plate
6. Bakeout
7. Protoflight campaign
8. Send it to be integrated to the deployer
9. Have pizza

## SOFTWARE

1. Find a purpose for the mission
2. Write some code that at least transmits what needed by mission
3. Flash the firmware
4. Have pizza

## DEPLOYER

- 1) Design the deployer
- 2) Design mass simulator
- 3) Build mass simulator
- 4) Build qualification deployer
- 5) Qualify qualification deployer (TVAC/Vibration)
- 6) Build Flight deployer
- 7) Protoflight campaign for all payload
- 8) Integrate payload
- 9) Have pizza

# The birth of PICOBUS

- 2 x 4p Rails
- Constant force springs
- Dual thermal knife release
- Becomes an actual service by LSF

# TVAC and Vibration

# Conformal coating

# Send ideas to space

# Protoflight

# On the software side

- Implemented fully functional AX5043 driver
- Telemetry and Telecommand
- FSM Control
- New project - Open Space Data Link Protocol
  - CCSDS Space Packet
  - CCSDS TM Space Data Link Protocol
  - CCSDS TC Space Data Link Protocol
  - Communications Operation Procedure-1
- MAX17261 Power supervisor driver
- GS Telecommand software

# SatNOGS Integration during development

# Integration

# About the launch

- Part of DREAM payload
- Organized by FOSSA Systems
- Firefly ALPHA

The unplanned mission of an unbuilt satellite to be integrated into a deployer that does not exist on a rocket that has never launched before

## Facilities

TVAC at Instituto Nacional Técnica Aeroespacial, Madrid arranged by FOSSA Systems

Vibration test at Universitat Politècnica de Catalunya, Barcelona arranged by FOSSA Systems

Bake-out at IESL, FORTH
